ARIZONA AGRICULTURAL STATISTICS
Historical Summary of County Data 1965-1980

Arizona Crop and Livestock Reporting Service

ABOUT THE COVER

The image on the cover is a scene of Arizona as seen by a Landsat satellite. The satellite is one of two Landsats in circular orbits 570 miles above the earth's surface. Energy reflections from earth's surface are sensed by multispectral scanners on board the satellite. These bits of information are beamed to NASA computers which produce pictured images. The satellite's multispectral scanners sense the earth's radiation in four spectral bands ranging from green to near-infrared. The green croplands are highly reflective in the near-infrared portion of the spectrum and appear as light tones on the cover picture, while the high absorption characteristic of open water makes the lakes and rivers appear in very dark or black tones. Features as small as 1.1 acres can be sensed by the sensor system carried by the craft. U.S.D.A. and other agencies are now developing plans to use such imagery for determining current land use and resource distributions, as well as other uses.

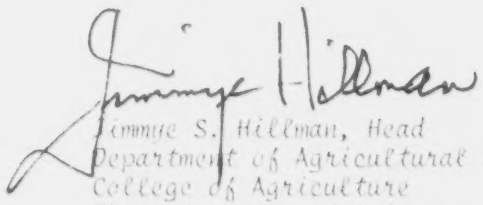
INTRODUCTION

This sixteenth edition of "Arizona Agricultural Statistics" is unique for several reasons. First of all, it is expanded to contain the sixteen-year series of estimates. This issue, in combination with the first edition released in 1966, contains the State's entire official statistical series, spanning the years 1867-1980. Second, this issue contains the entire series of county estimates available. The single exception is cotton, for which county estimates were made prior to 1965 and are thus contained in the first edition. Third, recent years' estimates are reviewed every five years, as the Department of Commerce's Agricultural Census data becomes available. This issue contains any revisions that may have resulted from the review which followed the 1978 Census.

The Arizona Crop and Livestock Reporting Service and we in the College of Agriculture are perpetually mindful that our's is a mission of service to the agricultural industry. It is in the spirit of service that we take pride in our State-Federal cooperative program of agricultural statistics and the sixteen years of joint existence that this report represents. By combining resources we are able to present a more detailed and comprehensive data series while maintaining the integrity of the estimates.

We remind our data users, who represent all facets of the nations' economy and society, that the basic data for most of the estimates contained herein are provided by Arizona's farmers and ranchers. Their voluntary participation has characterized the program from its inception well over a century ago. We also reaffirm the unbiased manner in which these data are collected, assembled and presented, so they may continue to be useful and reliable to all.



Jimmye S. Hillman, Head
Department of Agricultural Economic
College of Agriculture

1981	7,100	38,800	5,465	2,419,000	1,041,370	430

FARMS AND RANCHES AND LAND IN FARMS AND RANCHES: Farm and ranch numbers in Arizona have trended upward since 1975, while land in farms has declined. Nationally, farm numbers have trended downward along with land in farms. Farms are defined as places from which $1,000 or more of agricultural products were sold, or normally would be sold, during the previous year.

In Arizona, increasing farm numbers are due to growth in mini-farms and specialty operations such as nurseries, fish and worms. The 1978 census of agriculture counted 24 percent of Arizona's farms on places of less than 10 acres. An aggregate of 73 percent were on places of less than 500 acres. The national 1978 farm count shows 9 percent of the nation's farms on places of less than 10 acres and an aggregate of 85 percent on places of less than 500 acres. The average size farm or ranch in Arizona is almost 5,500 acres, compared with the national average of 430 acres.

1/ Preliminary.

1980 Agricultural Summary

WEATHER: Overall weather conditions in Arizona during early 1980 were variable but nowhere near the experiences of 1978 and 1979 when cold, rainy and flooding conditions frequently occured. From January through March, overall temperatures averaged near normal. There were intermittent rains several times during the winter, however, only one storm near mid-February caused serious flooding and significant delays in field activities. During the April through June period, temperatures started off near normal. By the end of April a cold front moved in and temperatures averaged as much as 25 degrees below normal through May and into early June. By mid-June temperatures were near normal and by month's end they were well above normal. Intermittent, moderately heavy rain fell in late April. Rains tapered off in early May and conditions were mostly dry through June. From July through September, conditions in the major cropping areas were hot, humid and fairly dry. Most of the rainfall was confined to the central and eastern mountains. October, November and December saw mostly mild conditions with temperatures averaging mostly above normal. Rainfall was spotty and restricted mostly to the north central and eastern portions of the State.

CROPS: Growing conditions for winter vegetables, small grains, sugarbeets, etc. were very good during the early part of 1980. Only during mid-February, when the State was experiencing cold, wet conditions were field activities halted for any appreciable time. Cotton planting proceeded smoothly with only limited replanting required due to poor weather condition. Growers planted an estimated 590,000 acres of upland cotton and 42,200 acres of pima cotton. By mid-June, conditions turned hot and mostly dry the remainder of the year with nearly excellent weather for harvest of sugarbeets, alfalfa, small grains, sorghum, vegetables and melon crops. Cotton conditions were generally so good late in the year that growers in many areas held off defoliation and irrigated their fields later than normal to develop the late top crop. This was, for the most part, a surprising bonus in terms of yield. Late fall saw small grains for 1981 being planted at a higher than normal rate, due both to a planned increase in acreage and nearly ideal planting conditions. During 1980, yields were up substantially for virtually all the major field crops produced in Arizona.

LIVESTOCK: The ending inventory for all cattle in the State in 1980 increased 25,000 head from January 1, 1980 inventory of 1.05 million head. Range and pastures began the year in poor condition but improved to fair to good following February and March rains. A shortage of rain during the summer and fall led to very poor conditions with severe drought in southwestern deserts by year's end. Heavy selling of range cattle was reported in the fall of 1980 as a result of the poor range conditions and high feed costs. Feedlot production was down sharply in 1980 with fed cattle marketings 17 percent below a year earlier. Hog and pig inventories increased 21 percent during the year while sheep and lamb inventories declined 3 percent.

Vegetables & Melons

Estimates of acreage, yield, production, price and value are prepared for the major commercial vegetable and melon crops in Arizona. Crops for which estimates are prepared are broccoli, carrots, cauliflower, lettuce, dry onions, cantaloups, watermelons, honeydews and potatoes. Estimates for these crops are prepared on both a State and county level.

Weather, market conditions, increased costs, urbanization and other factors have taken their toll among fresh vegetable and melon growers in Arizona. And, few industries will see massive, most often daily, price changes as are seen in the fresh market vegetable and melon industry. As a result, vegetable and melon acreage in Arizona has been on a steady decline over the last few years. Lettuce, the perennial leader among the fresh market crops, has declined from almost 56,000 acres in 1965 to the present estimate of 37,500 acres for the 1979-80 crop year. Production and value of lettuce in 1965 were 10.1 million hundredweight, and $54.5 million respectively. In 1980 production dropped to 8.3 million hundredweight while value increased to $71.3 million. Melons, primarily cantaloups, watermelons and honeydews, are a distant second to lettuce in production and total value. In 1965 Arizona produced almost 2.8 million hundredweight of melons from nearly 22,700 acres. The melon crops were valued at $15.8 million. In 1980 only 11,500 acres of melons were harvested producing 1.7 million hundredweight with a value of $20.2 million. Acres of potatoes, both fresh market and processing varieties, have declined rather sharply over the last few years. In the late 1960's acreage hovered in the 11,000 - 13,000 acre range. In 1980 Arizona grew 4,400 acres of potatoes. The 1965 crop was valued at $9.7 million, while the 1980 crop was valued at $7.0 million. Production in 1965 was 2.3 million hundredweight and in 1980, 1.3 million hundredweight, down 44 percent.

Fruit

Citrus in Arizona dates back to the late 1800's when the first commercial orange grove was planted by W. J. Murphy in the Arcadia area of north Phoenix. Early Yuma planting began shortly afterward on the desert mesa south of the city. Poor prices and limited water availability in the early 1900's along with a freeze in 1913 reduced the Salt River Valley acreage to approximately 600 acres. In the Yuma area, as additional water was brought from the Colorado River, rapid expansion took place from 1920 to the mid-30's when about 1,300 acres, mostly grapefruit, had been planted. After World War II very rapid expansion of the Yuma mesa acreage resulted from additional land and water availability and an influx of new grower interest.

Minimum frost protection required on the Yuma mesa made lemons the predominate variety planted through the 50's and early 60's, and good returns were realized. High returns from Valencia oranges during this same time period prompted large scale plantings of Valencia oranges in the Salt River Valley, Wellton and Yuma areas. Navel planting also expanded and has continued to be an important part of the citrus picture in the Salt River Valley. Higher returns and the development of the desirable red blush grapefruit also prompted large plantings in the 50's and 60's, particularly in the Salt River Project area. Nearly all interest today in grapefruit is in the red blush variety.

Other citrus varieties of importance in the State are mixed tangerines and tangelo-types, including the Kinnow mandarin, Orlando and Minneola tangelos and Algerian tangerine. Sweet seedling oranges including the Hamlin, Diller and other named varieties provide mid-season fruit for commercial sales. Per box returns on sweets are generally lower than Navel or Valencia but per tree yields are higher. Very low white grapefruit returns in the two districts has prompted removal of several hundred acres of this variety in the past ten years.

A federal reclamation project and severe freezes have reduced the acreage in the Wellton area of Yuma County drastically. In the Salt River Valley, urbanization and some economic abandonment have reduced the total citrus acreage to below 17,000 acres.

While growers have had some excellent returns, particularly during the years when cold weather damaged competing areas, across the board returns have not kept pace with the much higher cost of producing, picking and packing citrus. The development of the juice concentrate industry in Florida, the emergence of south Texas as a strong competition for the grapefruit market and the high volume production of Navel oranges from central California are all factors having an impact on the Arizona Citrus Industry.

Cattle

The cattle industry is a major source of revenue for Arizona agriculture. The value of beef produced by cattle on feed, dairy and range cattle operations in 1980 totaled $408 million up from $366 million in 1979. The value of milk produced in 1980 by Arizona dairies totaled $139 million compared with $119 million in 1979.

Arizona currently ranks 35th in the United States in total cattle inventory. However, the State ranks 8th nationally in total cattle on feed. On January 1, 1981, thirty-seven percent of the State's inventory of cattle and calves were in feedlots. Because of its importance, Arizona is included in the monthly survey of seven cattle on feed states. This survey provides current information on the cattle on feed inventory and expected marketings of cattle.

Dairying is also an important contributor to Arizona agriculture. Quantity of grain fed per cow and milk produced per cow are among the highest in the U.S. The number of milk cows and milk production have increased substantially in the last 8 years. In 1972 a total of 51,000 milk cows were on farms while in 1980 the total reached 75,000 head.

Range cattle and calves make up the majority of the cattle inventory in Arizona. Range operations utilize large tracts of publicly held grazing land which are leased primarily on a per head basis from the Bureau of Land Management, Forest Service, State and Indian agencies. Range cattle accounted for 54 percent of the total cattle inventory on January 1, 1981.

Increasing production costs have been a major problem for Ariozna cattlemen. Costs for feed, building materials, and other production inputs have increased substantially over the last several years, while cattle prices have not kept pace with those increases. The result has been lower profitability and economic difficulty for many operations.

Cattle and calves on January 1, 1981 totaled 1,075,000 head, down 2 percent from the previous year. Of this total 401,000 were cattle on feed, 582,000 range cattle and 92,000 milk cows and replacement heifers.

The total value of all cattle and calves on Arizona farms for January 1 was $494.5 million. This is up 1 percent from the previous year and up 7 percent from 1979. Total marketings for 1980 were 918.5 million pounds down 15 percent from 1,025.1 million pounds in 1979.

Hogs

The Arizona pork industry has experienced rapid growth in the last 15 years. In 1965, hogs and pigs totaled 28,000 head and by 1980,inventories reached 180,000 head. The years of 1978 through 1980 included the most rapid growth with an increase of 78,000 head.

Hog operations in Arizona are among the most modern in the nation, with producers concentrating on quality and efficiency to assure a high quality product to the consumer. Farrow to finish operations are the most prominent in the State. Most pigs are raised under confinement in climatically controlled facilities to reduce stress and death loss during the adverse summer temperatures.

Most Arizona pork is currently slaughtered in the State and in California where large population centers provide demand for fresh and processed pork products.

Although the pork industry has been expanding in Arizona, recent years have presented the obstacle of decreasing profitability of the enterprise. Operators have been faced with a large increase in production costs during 1980. Average price received for hogs and pigs during 1980 was $41.20 per cwt. compared to $44.10 in 1979 and $50.40 in 1978. This combination of falling hog prices and increased production costs has created serious hardship for Arizona's pork producers.

The inventory of hogs and pigs on Arizona farms totaled 180,000 head as of December 1, 1980, up 21 percent from a year earlier. Hogs and pigs kept for breeding at 23,000 head was also up 21 percent from the previous year. Market hogs at 157,000 head were up from 21 percent from a year earlier.

The Arizona pig crop for 1980 totaled 281,000 pigs, an increase of over 16 percent from the 1979 number. The spring crop (December 1979-May 1980) totaled 137,000 head, up 10 percent from a year earlier. A total of 19,000 sows farrowed during the period with an average litter rate of 7.2 pigs. The fall pig crop (June-November 1980) was 144,000 head, a 25 percent increase from last year. A total of 20,000 sows farrowed averaging 7.2 pigs per litter.

The total value of all Arizona hogs and pigs as of December 1, 1980 was $11,880,000, up 34 percent from December 1, a year earlier and the highest of record. The average value per animal on December 1, 1980 was $66.00, an increase of 11 percent from $59.50 a year earlier. Marketings for 1980 totaled 54.5 million pounds, down slightly from 1979.

Sheep

The inventory of sheep and lambs has declined 39 percent over the last 15 years, from a high of 605,000 head in 1965, to 372,000 by the end of 1980. This continues the declining trend in total sheep and lambs which began in 1917. In that year 1.42 million sheep and lambs were reported in Arizona.

Sheep and lambs on feed have declined in the last six years from 130,000 in 1975 to 47,000 in late 1980. The years 1975 and 1966 are tied for the record number of sheep and lambs on feed at 130,000.

Declining interest in sheep production as well as higher production costs have contributed to the decline in sheep inventory. Sheep numbers on the Navajo Indian Reservation, which accounts for a large part of the total State inventory, have continued to decline over the years.

Honey & Beeswax

Arizona farming practices have changed in the past few years. Many of these changes have been beneficial for beekeepers. Balance between beneficial and damaging insects in cotton have been closely monitored and controls applied when needed. This is less frequent than in the past when pesticides were applied as soon as damaging insects were found regardless of the presence of beneficial insects. In cooperation with beekeepers, many farmers are applying their pesticides at night when bees are in the hives. This has reduced bee kills substantially. But, even with the cooperation from many farmers on pesticide application, there is still a high bee kill.

Pesticide damage along with high fuel costs and low wholesale honey prices may discourage expansion in the Arizona bee industry. Colonies have to be moved as needed for pollination of certain crops. Fuel cost for transporting and monitoring colonies is increasing much faster than the prices received by the beekeepers for their honey. The average price per pound for honey received in 1974 was 44.6 cents. The 1980 average price was 54.3 cents, less than a 10 cent increase per pound.

Production of honey and colony survival was reasonably good for the Arizona beekeepers in 1980. Decreased pesticide usage on crops decreased the death loss among the State's bee colonies. This, along with the above normal rainfall in the spring, made for a substantial increase over the last several years in honey and beeswax production.

HONEY AND BEESWAX: Number of colonies, yield, production and value, Arizona, 1965-80

1/ Based on 15-year period, 1963-77.
2/ Average is for less than 15 years of record.

WATER SUPPLY: The anticipated streamflow in Arizona is much below average. Water storage in major reservoirs is still above average and will provide adequate water to users having access to it. Water users relying on small local impoundments or direct stream diversion should prepare for reduced water supplies.

SNOW COVER: Snowpack water continues to be far below average as of March 1. The snowpack on the Verde watershed was 18% of average; on the Salt River watershed, 21%; on the Gila drainage, 29%; and on the Little Colorado, 24%.

PRECIPITATION: February precipitation ranged between 70% and 90% of average on the snow zone areas of central Arizona. Precipitation is still only about 40% of average for the November-February winter season.

STREAMFLOW: February inflow to the Salt River Project system was 34,000 acre-feet, 33% of average for this month. Streamflow on the Gila was about 22% of average, and 28% of average on the San Francisco River.

RESERVOIR STORAGE: The six Salt River Project reservoirs have a combined storage of 1,478,000 acre-feet, which is 72% of capacity. San Carlos Reservoir is at 60% of capacity, with 645,000 acre-feet. Lake Pleasant contains 104,000 acre-feet, 66% full. Lyman Reservoir on the Little Colorado River holds 23,400 acre-feet at 76% capacity. Four major reservoirs on the Colorado River contain a combined storage of 47,437,000 acre-feet, 89% of capacity.

Grain production, tons	190,400														
Sugarbeets: Acres harvested	17,000		4,330			360		4,370				4,990			3,050
Production, tons	366,000														
Safflower: Acres harvested	44,500							14,800				24,700			5,000
Production, tons	54,500														
Vegetables: Acres harvested	61,700		900					20,290			2,780	4,860			32,840
Production, cwt.	12,214,000														
Grapefruit: Acres harvested	9,590							6,850			*	*			2,740
Production, ctns.	5,540,000														
Oranges 2/: Acres harvested	31,200							15,500			*	*			15,700
Production, ctns.	11,160,000														
Lemons: Acres harvested	20,520							2,670			*	*			17,850
Production, ctns.	14,400,000														
Other Crops 3/: Acres harvested	59,360	600	10,100	400	500	650	450	16,200	400	1,700	4,750	6,700	300	970	15,640

1/ Separate estimates made for Durum and Winter Wheat beginning with 1976 crop year. May include some Durum Wheat in 1975.
2/ Includes tangerines and tangerine types.
3/ Includes miscellaneous fruits, vegetables and field crops not listed above.
*Acres harvested too small to warrant quantitative estimate. Acres, if any, are included in State totals.

PRINCIPAL CROPS: Acreage harvested by counties and total State production, Arizona, 1976
